The actual portfolio may vary and all data is subject to rounding. Negative positions may result from timing differences between trade and settlement dates of holdings purchased by the fund and/or the use of certain financial instruments, including derivatives, which may be used to gain or reduce market exposure and/or risk management. The snapshot represents the estimated net market exposure of the fund, accounting for futures and collateral held against futures. The gross market exposure – the sum of long exposures, including futures may exceed 100%.
